

EstatePro Reporting System - Setup Guide

Real-Time Collaboration with GitHub Sync

This guide explains how to set up and use the enhanced EstatePro Reporting System with real-time team collaboration.

What's New?

The system now includes **GitHub Sync** functionality that enables:

- ☒ Real-time report sharing across all team members
 - ☒ Automatic backup of all reports to your GitHub repository
 - ☒ Conflict-free collaboration - everyone sees the same data
 - ☒ Version history and data recovery through GitHub
 - ☒ Works on any device with internet access
-

Prerequisites

Before you begin, ensure you have:

1. A GitHub account (free account works fine)
 2. Write access to the `estate-report` repository
 3. Basic understanding of how to generate a GitHub Personal Access Token
-

Setup Instructions

Step 1: Generate a GitHub Personal Access Token

1. Go to GitHub and log in to your account
2. Click on your profile picture (top-right) → **Settings**
3. Scroll down and click **Developer settings** (left sidebar)
4. Click **Personal access tokens** → **Tokens (classic)**
5. Click **Generate new token** → **Generate new token (classic)**
6. Fill in the form:
 - **Note:** EstatePro Reporting System
 - **Expiration:** Choose `No expiration` or set a long expiration
 - **Scopes:** Check the `repo` checkbox (this gives full repository access)
7. Scroll to the bottom and click **Generate token**
8. **IMPORTANT:** Copy the token immediately! It looks like: `ghp_XXXXXXXXXXXXXXXXXXXX`
 - You won't be able to see it again
 - Save it somewhere safe temporarily

Step 2: Configure the EstatePro System

1. Open the EstatePro website: <https://enoghayinmartins5-sys.github.io/estate-report/>
2. Click on **Settings & Sync** in the left sidebar
3. In the configuration form, enter:
 - **GitHub Token**: Paste the token you copied in Step 1
 - **Your Name**: Enter your full name (e.g., "John Doe")
 - **Your Email**: Enter your work email
4. Click **Save Configuration**
5. Click **Test Connection** to verify it works
 - You should see a green "Connected successfully!" message

Step 3: Enable Sync

1. After configuration, you'll see an "Enable Sync" toggle
2. Turn it **ON**
3. The system will perform an initial sync automatically
4. You're now set up! 🎉

How to Use

Creating Reports

1. Click **Daily Report** in the sidebar
2. Fill in your department's report form
3. Click **Submit Report**
4. The report is saved **locally** (in your browser)
5. If sync is enabled, it's **automatically pushed to GitHub** within seconds
6. All team members will receive the update on their next sync

Viewing Reports

- **Dashboard**: See all reports aggregated
- **Weekly/Monthly/Yearly**: View summary analytics
- **Search Reports**: Find specific reports by date, department, or content

Manual Sync Operations

In **Settings & Sync**, you have three manual sync options:

Pull from GitHub

- Downloads all reports from GitHub
- Replaces your local data with GitHub data
- Use this when: You want to get the latest reports from your team

Push to GitHub

- Uploads your local reports to GitHub
- Use this when: You have reports locally that aren't on GitHub yet

Full Sync (Recommended)

- Intelligently merges local and GitHub data

- Keeps all reports from both sources
 - Use this when: You want to ensure everything is synchronized
-

Team Collaboration Workflow

For the First Team Member (Admin)

1. Set up GitHub sync as described above
2. Create a few sample reports
3. Ensure sync is enabled and reports are pushed to GitHub
4. Share the setup guide with other team members

For Additional Team Members

1. Each team member needs to:
 - Get their own GitHub Personal Access Token (Step 1)
 - Configure the system with their token (Step 2)
 - Enable sync (Step 3)
2. On first load, the system will download all existing reports from GitHub
3. Now everyone is synchronized!

Daily Usage

1. **Morning:** Open the website - it automatically syncs on load
 2. **Throughout the day:** Submit reports as usual
 3. **Reports auto-sync:** Every report is pushed to GitHub immediately
 4. **Periodic sync:** The system syncs every 5 minutes automatically
 5. **Manual sync:** Use “Full Sync” button if you want to force an immediate update
-

Security & Privacy

- **Tokens are stored locally:** Your GitHub token is only saved in your browser’s local storage
 - **Not shared:** The token never leaves your device
 - **Team visibility:** All team members with the token can see all reports
 - **GitHub protected:** Your repository is protected by GitHub’s security
-

Important Notes

Token Expiration

- If you set an expiration on your token, you’ll need to generate a new one when it expires
- Update it in Settings & Sync when that happens

Internet Requirement

- GitHub sync requires an active internet connection
- Local reports are saved even without internet

- They'll sync when you're back online

Data Conflicts

- The sync system uses "merge" logic - it keeps reports from both sources
- Each report has a unique ID, so duplicates are impossible

Repository Access

- All team members need write access to the repository
 - The repository owner can manage permissions in GitHub settings
-

Troubleshooting

"Connection failed: 401 Unauthorized"

- Your token is invalid or expired
- Generate a new token and save it in Settings

"Connection failed: 403 Forbidden"

- Your token doesn't have `repo` permissions
- Generate a new token with the `repo` scope checked

"No reports showing up"

- Make sure sync is enabled
- Click "Pull from GitHub" to download reports
- Check if you have internet connection

"Reports not syncing"

- Check if sync toggle is ON in Settings & Sync
 - Try clicking "Full Sync" manually
 - Check browser console for error messages (F12 → Console tab)
-

Additional Features

Backup & Export

- You can still export reports as JSON files from "Backup & Export"
- This provides an additional backup layer

Department Filtering

- Each team member can switch between department views
- Admins see all departments
- Department users see their own department by default

Analytics

- Dashboard shows real-time statistics
- Weekly/Monthly/Yearly summaries with charts
- Estate performance tracking

Best Practices

1. **Enable sync immediately** after setup
 2. **Check the dashboard daily** to see team progress
 3. **Use meaningful names** when configuring (your real name)
 4. **Don't share your token** - each person should have their own
 5. **Regular backups**: Export JSON backups monthly as extra safety
 6. **Keep repository private**: The repository contains company data
-

Support

If you encounter issues:

1. Check this guide first
 2. Try the troubleshooting section
 3. Check the GitHub repository's Issues tab
 4. Contact your system administrator
-

Version History

v2.0 - GitHub Sync Release

- Added real-time collaboration via GitHub
- Auto-sync on report submission
- Periodic background syncing
- Manual sync controls
- Settings & configuration page

v1.0 - Initial Release

- Local storage only
 - Basic reporting features
 - Dashboard analytics
-
